

1. Install MySQL

E.g., on CentOS

```
yum install mysql-server
```

Launch MySQL

```
/sbin/service mysqld start
```

Set the root password

```
/usr/bin/mysqladmin -u root password 'rootpassword'
```

2. Create MySQL database and user for WCS

Log in to MySQL

```
mysql -uroot -prootpassword
```

Create database and user and grant the user privileges to the database

```
create database wcs;
```

```
create user 'webcallserver'@'localhost' identified by 'password';
```

```
grant all privileges on wcs.* to 'webcallserver'@'localhost';
```

3. Configure WCS

Add the following properties to WCS_HOME/conf/wcs-manager.properties

```
-Dspring.datasource.url=jdbc:mysql://localhost/wcs
```

```
-Dspring.datasource.driverClassName=com.mysql.jdbc.Driver
```

```
-Dspring.datasource.database=org.hibernate.dialect.MySQL5Dialect
```

```
-Dspring.datasource.username=webcallserver
```

```
-Dspring.datasource.password=password
```

Here

- 'wcs' is the name of the database

- 'webcallserver' and 'password' are the name and password of WCS MySQL user

Restart WCS server

```
service webcallserver restart
```
